

1. A method for routing telephone calls at customer premises having a telephony switch, individual telephones connected to the telephony switch, and computer workstations including video display units (VDUs) connected on a local area network (LAN) also coupled to the telephony switch, wherein individual ones of the computer workstations are located proximate individual ones of the telephones, the method comprising steps of:

(b) providing identifying data for the telephone call to a client-server router;

(d) routing the telephone call by the client-server router according to the determination transmitted to the client-server router via the LAN connection from the client interface application.
